Wrangle:

In this project we are going to learn how to gather the data,clean the data and then analyze the data. As you know data wrangling is the important for Data Analyst.

Here in this project we are using WeRateDogs data which is a twitter archive. WeRateDogs consists of some basic tweet data about dogs.The goal of the project is to clean the data and do analyses and visualization on the given data.

In this project we are using only twitter data about dogs. Firstly we import the data to pandas to perform data wrangling.
Then we look for issues in the data like tidiness issues and quality issues.11 quality issues and 1 tidiness issues like retweet which are not needed ,four variables needed to be merged.
Then data has to be cleaned to analyze the data.
